                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human CD4 cDNA was excised from pSP6T4 and cloned into M13mp18. The 2 kb pstI/PstI fragment from pBR lambda 1 contg. the human lambda 1 heavy chain gene (contg. the hinge, Ch2 and CH3 exons) was isolated and cloned into the BAP-trasted M13mp18/CD4 vector. To obtain a CD4-lambda 1 chimeric heavy chain gene, oligonucleotide-mediated site-directed mutagenesis was performed to juxtapose the CD4 and lambda 1 heavy chain DNA sequences, ligating the CD4 sequence in frame to the hinge exon. The DNA was then cloned into pcDNA-1 to produce CD4-1gG1-pcDNA1 (ATCC 40951). (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 435 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Example; Fig 3;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a CD4 (cluster of differentiation factor 4) polypeptide ligated at its C-terminus with a portion of an immunoglobulin (1g) comprising a hinge region and a constant domain of a mammalian Ig heavy chain. The polypeptide comprises a tailpiece from the C-terminus of the heavy chain of an IgA or IgM antibody. Polypeptides of the invention are useful for preparing a composition for treating or preventing human immunodeficiency virus (HIV)-1 infection. The invention is useful in gene therapy and also in the preparation of vaccines. The present sequence is a fusion protein which comprises a human IgA alpha tailpiece (alphatp), a

                                                                                                                                                                                                                             The human CD4 cDNA is excised from the plasmid pSP6T4 and cloned into M13mpl8. In order to excise a fragment containing the CH1 exon of the human gamma 1 heavy chain gene, the plasmid pBr gamma 1 is digested with SacII, and the SacII sites are then made flush using T4 DNA polymerase. The fragment containing the CH1 exon is then purified and ligated to the M13mpl8(CD4) vector. Oligonucleotide-mediated site-directed mutagenesis is then performed to juxtapose the CD4 and CH1 sequences in frame. The CD4-CH1 chimeric gene is then linearized and ligated to the Pst1-Pst1 DNA fragment of the plasmid pBr gamma 1 containing the hinge, CH2, and CH3 exons of the human gamma 1 chain gene designated CD4-IgGiHC-pRcCMV (ATCC 75192). (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Region

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           heavy chain. The polypeptide comprises a tailpiece from the C-terminus the heavy chain of an IgA or IgM antibody. Polypeptides of the invention are useful for preparing a composition for treating or preventing human immunodeficiency virus (HIV)-1 infection. The invention is useful in getherapy and also in the preparation of vaccines. The present sequence is a fusion protein variant (6218F/L219V/220delA/G221A) which comprises a human IgA alpha tailpiece (alphatp), a human IgG2 constant region comprising a hinge, a CH2 and CH3 region and a human CD4 D1D2 domain. This variant protein is also referred to as mutant F

The CD4 portion of the fusion protein may comprise the complete CD4 sequence, the 370 AA extracellular region and the membrane spanning domain, or the extracellular region. The Ig heavy chain is pref. from IgM, IgG1 or IgG3. The following are specifically claimed: fusion proteins CD4H-gamma-1, CD4Mmu, CD4P-gamma1, and CD4Mmu (NO.67608), pCD4P-gamma (NO.67609) and pCD4E-gamma1.

(NO.67610). The plasmid containing (pCD4E-gamma-1) has been deposited in E. col1 (MC1061/P3) at the ATCC under accession number 67610. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 631
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Immunoglobulin-CD4 fusion proteins - used for treating HIV infections or detecting HIV or SIV in sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               WPI; 1989-214472/30

                                                                                                                                                                                    The present sequence is that of fusion protein CD4Egammal comprising the extracellular portion of CD4, which binds to HIV gp120, linked at its C-terminus to the human IgG1 heavy chain. To obtain the fusion protein, DNA encoding CD4 was linked to IgG1 DNA at the Esp site upstream of the hinge region (see AAA50661). Fusion protein CD4Egammal and a nucleic acid encoding it are claimed. Also claimed are vector comprising the nucleic acid, and a method of producing the fusion protein in secreted form using a transformed host cell. The fusion protein may further comprise a therapeutic agent, radiolabel or NMR imaging agent. The fusion protein can be administered to an animal (including humans) for treatment of HIV or SIV infection, and can also be used in assays for HIV or SIV, imaging and tissue stains. IgG1 fusion proteins such as CD4Egammal provide both
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    22-JAN-1988;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention describes a novel nucleic acid (I) encoding a fusion protein comprising a DNA sequence encoding amino acids 1-173 of CD4 (II) and a DNA sequence encoding a mino acids 1-173 of CD4 (II) and a DNA sequence encoding a human immunoglobulin (Ig) heavy or light chain (III). The products pf the invention have anti-human immunodeficiency virus (HIV) activity and are capable of binding to gpl20. The fusion protein is useful for treating human immunodeficiency virus (HIV) or simian immunodeficiency virus (SIV). This sequence represents the fusion protein CD4Egammal which is constructed from CD4 linked to human IgG1 upstream of the hinge region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Example 1;

The fusion protein is capable of being secreted. The fusion proteins are useful for treating HIV or SIV infections in animals, preferably humans. They are also useful for producing medicaments which can be used for treating HIV or SIV infections in animals, preferably humans treating HIV or SIV infections in animals, preferably humans. They are also useful for producing medicaments which can be used for treating HIV or SIV infections in humans. The present sequence represents the fusion protein CD4Egamman where the CD4 is linked to human IgG1 at the Esp site upstream

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 24-OCT-2003
25-MAR-2003
06-FEB-1993
was produced by expresion of the coding mutagenised cDNA (produced as described in AAQ28088) in Dhfr-CHO cells. The protein is efficiently assembled intracellularly and effectively secreted from mammalian cells pref. CHO, COS, or myeloma cells as a homodimer, enabling high recovery and purification from the medium of cells expressing it. It possesses
                                                                                                     CD4-gamma-2 and CD4-IgG2 chimera(s) and expression vectors treatment, prevention and diagnosis of HIV infection.

It can inhibit HIV infection of CD4+ cells and block the spread of HIV infection within a patient. Attachment to a detectable marker makes it useful in an assay for HIV or SIV infection, and it can also be linked to toxins, eg Diphtheria, Pseudomonas exotoxin A (domainS I or II) or the deglycosylated A-chain of ricin. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 24-OCT-2003 to standardise OS field)
